# Grade 7 Math <br> Unit 1 Notes: Patterns \& Relations 

## Section 1.4: Relationships in Patterns

A number pattern may be described by using the term number...

| Term <br> Number | 1 | 2 | 3 | 4 | 5 | 6 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Term | 6 | 12 | 18 | 24 | 30 | 36 |

In this case each term is 6 times the term number.

We can let " $n$ " represent any term number.

| Term <br> Number | 1 | 2 | 3 | 4 | 5 | 6 | $\ldots$ | $n$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Term | $6 \times 1=6$ | $6 \times 2=$ <br> 12 | $6 \times 3=$ <br> 18 | $6 \times 4=$ <br> 24 | $6 \times 5=30$ | $6 \times 6=36$ | $\ldots$ | $6 \times n=$ <br> $6 n$ |

Then the term is represented by 6 xn , or $\mathbf{6 n}$ (As seen in the table above)

If we compare or "relate" a variable (" $n$ ") to an expression that contains the variable (6n), you have a relation.

If we wish to determine the 15 th term of this relation we substitute $\mathrm{n}=15$ in the expression 6 n.
$6 n=6 \times 15=90$
Therefore, the 15 th term of this relation is 90 . The major advantage of this is we do not have to find the previous 14 numbers in the table.
