

Grade 9 Math PAT Prep

1. Area, Scale, Grids

The pattern below is placed on a 1 cm grid. Determine the total area, in square units, of the black squares if the pattern continues to figure 6.

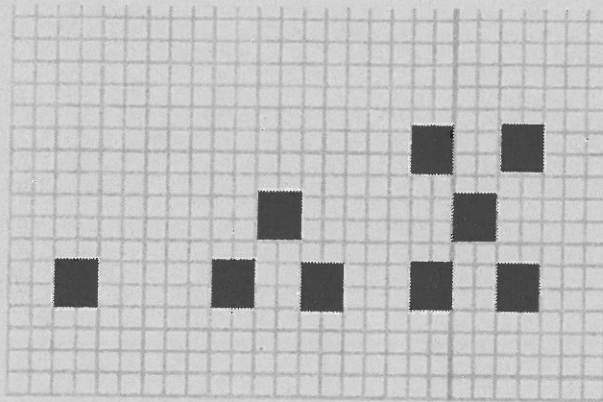

Fig. 1

Fig. 2

Fig. 3

2. Perimeter, transformations, and grid

If shape A is rotated 3 times about point 'c' clockwise 90 degrees. Calculate the perimeter, to the nearest unit, of the new

3. Area, Polynomials, composite shapes and exponent laws.

A contractor has designed a patio for a client that includes a fire pit with a diameter expressed by $4x - 8$. Determine the amount of material required to construct the patio excluding the fire pits area. ($\pi \doteq 3.14$)

4. Polynomials, Shapes, Equations, and Scales

The images below have been enlarged.
Continue the pattern and determine the perimeter of figure 4.

5. Exponent laws, rational numbers & using models to solve an equation

The model below represents a polynomial expression. The white tiles are (-) negative and the black tiles are (+) positive.

6. A circle with a diameter of 32 cm is used to construct a sign. The area of the hexagon will be covered with a reflective material. Calculate the area of the hexagon to the nearest 10th of a centimeter. ($\pi = 3.14$)
